WORKING PAPERS      **"Long Run Effects of Folic Acid Fortification,"**  
Job Market Paper, 2025  
Presentations: *AEA Health Policy Lightning Session at ASSA 2025 (scheduled)*; *AAEA 2024*

Policy makers are increasingly concerned about the effectiveness of existing nutritional interventions, which are often limited by the challenge of changing consumer behavior. Food fortification offers a promising alternative by enhancing the nutritional content of widely consumed foods without requiring changes in consumer habits. This is particularly relevant in addressing micronutrient deficiencies, where fortification can serve as a scalable and low-cost solution. This paper studies the most recent food fortification effort in the U.S.—the folic acid fortification of enriched grain products, which was mandated by the U.S. Food and Drug Administration in March 1996 to prevent deficiency in folate, a critical micronutrient for fetal neurodevelopment. This policy substantially increased folate intake and reduced the incidence of birth defects. By comparing cohorts exposed and unexposed to the fortification across regions with varying baseline folate deficiency levels, I find that (1) in the short term, fortification increased the proportion of births among disadvantaged mothers, likely due to improved fetal survival rates; and (2) in the long term, in-utero exposure to folic acid fortification raises the likelihood of post-secondary enrollment for young adults by 0.69 to 1.17 percentage points. It also reduces the likelihood of working full-time among 19-to-22-year-olds by 0.79 to 1.54 percentage points but has no impact on the labor supply of individuals over

22. Finally, my back-of-the-envelope calculation indicates that folic acid fortification provides long-term human capital benefits comparable to those of food stamps but at a significantly lower cost.

**"The Impact of Electronic Benefit Transfer on WIC Participation: Evidence from Natality Data,"**

with Charlotte Ambrozek, and Timothy K.M. Beatty

Presentations: MEA 2025 (scheduled)

Policymakers have an interest in ensuring participation in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) – WIC has been shown to increase birthweight for participating mothers and improve long-run outcomes for children who participate in the first years of life. Between 2002 and 2022, WIC transitioned from paper vouchers to electronic benefit transfer (EBT) cards. This payment reform was expected to encourage WIC participation by streamlining benefit redemption and thereby reducing welfare stigma. Empirical studies of the effects of WIC EBT on participation have found mixed results, with studies often limited to one or a few states. Without detailed WIC participation data on a large scale, results are not generalizable. In this paper, we evaluate the impact of WIC EBT implementation on WIC participation nationwide by linking the WIC EBT roll-out schedule to Vital Statistics Natality Data across virtually all counties in the U.S. We document a significant increase in WIC participation among mothers more likely to be WIC-eligible following the implementation of WIC EBT. Additionally, we find that WIC EBT reduces adverse birth outcomes for infants born to these mothers. Our findings suggest that facilitating the delivery of public benefits can improve program uptake and well-being of participants in need.
