WORKING PAPERS      **"Long Run Effects of Folic Acid Fortification,"**  
*Job Market Paper*, 2025

Recent concerns about the effectiveness of existing interventions aimed at improving dietary quality, often hindered by the challenge of changing consumer behavior, have highlighted a relatively understudied intervention in the economic literature: food fortification. By enhancing the nutritional content of widely consumed foods without requiring changes to eating habits, food fortification offers a promising alternative that may overcome current barriers to improving dietary outcomes. This paper studies the most recent food fortification effort in the U.S.—the folic acid fortification of enriched grain products in the late 1990s. This policy substantially increased folate intake and reduced the incidence of birth defects. By comparing cohorts exposed and unexposed to the fortification across regions with varying baseline folate deficiency levels, I find that (1) in the short run, fortification increased the share of births among disadvantaged mothers, likely due to improved fetal survival rates; and (2) in the long run, in-utero exposure to folic acid fortification resulted in greater investments in human capital, evidenced by an increased likelihood of enrolling in post-secondary education and a decline in the labor supply of young adults. My findings suggest that food fortification has significant potential to improve dietary and health outcomes and to generate broad, long-lasting benefits for children.

**"The Impact of Electronic Benefit Transfer on WIC Participation: Evidence from Natality Data,"**  
with Charlotte Ambrozek, and Timothy K.M. Beatty

Policymakers have an interest in ensuring participation in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) – WIC has been shown to increase birthweight for participating mothers and improve long-run outcomes for children who participate in the first years of life. Between 2002 and 2022, WIC transitioned from paper vouchers to electronic benefit transfer (EBT) cards. This payment reform was expected to encourage WIC participation by reducing transaction costs and welfare stigma. Empirical studies of the effects of WIC EBT on participation have found mixed results, with studies often limited to one or a few states. Without detailed WIC participation data on a large scale, results are not generalizable. In this paper, we evaluate the impact of WIC EBT implementation on WIC participation nationwide by linking the WIC EBT roll-out schedule to Vital Statistics Natality Data across virtually all counties in the U.S. We document a significant increase in WIC participation among the likely eligible by 2.39-2.5 percentage points after EBT implementation. We also find WIC EBT reduces probability of low birth weights births by 0.47-0.62 percentage points and preterm births by 0.54-0.82 percentage points among the likely-eligible. Our findings suggest that facilitating the delivery of public benefits can improve program uptake and well-being of beneficiaries.
